

Milestone 2 Session 2

AI-generated Notes

- **Finalization of Student Learning Targets for Blockchain Credentials:** James, Anna, Yoram, Eric, and Sebastian collaboratively refined and finalized the student learning targets that will be written to the blockchain as the unchangeable contract for each course module, ensuring clarity, timelessness, and actionable outcomes for fans earning credentials.
 - **Immutability of Learning Targets:** James emphasized that once student learning targets are published on the blockchain, they cannot be changed, making them a permanent contract with learners. This led to a discussion about the importance of getting the wording precise and evergreen to avoid future constraints.
 - **Flexibility of Assignments and Lessons:** The group clarified that while learning targets are immutable, assignments and lessons can be updated over time to reflect new content, feedback from fans, or changes in the club's activities, allowing for ongoing adaptation and improvement.
 - **Cycle Structure and Credential Mapping:** Each course cycle corresponds to a separate credential, with four cycles currently planned. The team discussed how each cycle's learning targets would be grouped and written to the blockchain, and that the number of learning targets per credential can vary as needed.
 - **Language Precision and Timelessness:** Anna and Yoram raised concerns about using language that could become outdated or imply ongoing obligations, such as always being up to date with club news. The group agreed to use general, timeless language for learning targets to ensure their relevance and avoid unintended commitments.
 - **Actionable and Specific Outcomes:** The team worked to ensure that each learning target is actionable and specific, such as enabling fans to design use cases, distinguish between credential badges and digital collectibles, and share ideas for improving community initiatives through Web3 technology.

- **Terminology and Wording for Credentials and Badges:** Eric, Anna, and James discussed and debated the use of terms like 'credential,' 'badge,' and 'system' to ensure clarity for fans, ultimately deciding to use 'credential badges' for precision and to avoid confusion with Discord-native terms.
 - **Debate Over 'Credential' vs. 'Badge':** James suggested using 'badge' instead of 'credential' for better clarity, while Eric pointed out that 'badge' is already a term used in Discord, which could cause confusion. The group considered combining the terms for greater specificity.
 - **Avoiding Ambiguous Terms:** Anna highlighted that terms like 'system' could be confusing or too abstract for fans, and the group agreed to avoid such language in favor of more concrete and familiar terms.
 - **Final Decision on Terminology:** The team settled on 'credential badges' as the preferred term, ensuring that the language is both precise and distinct from platform-native terms, while remaining broad enough to cover future developments.
- **Design and Sequencing of Learning Targets Across Course Cycles:** The team, led by James and Anna, systematically reviewed and refined the learning targets for each course cycle, using a backwards design approach to ensure each target is actionable, relevant, and logically sequenced from foundational to advanced topics.
 - **Backwards Design Approach:** James introduced the backwards design method, starting with the most advanced cycle (cycle 4) and working backwards to ensure that each learning target builds towards the final outcomes and vision for fan engagement.
 - **Cycle 4: Leadership and Advanced Contribution:** The group refined learning targets for cycle 4 to focus on describing Barça Vision's role in the Web3 ecosystem, distinguishing credential badges from digital collectibles, sharing ideas for improving community initiatives through Web3, and using credential badges to create new engagement opportunities.
 - **Cycle 3: Applied Contribution Skills:** For cycle 3, the team emphasized connecting offline and online communities, understanding digital wallets as identity tools, and applying Web3 concepts like decentralization, permanence, and interoperability to real-world fan engagement.

- **Cycle 1 and 2: Foundational Knowledge:** Earlier cycles were designed to ground fans in the history, values, and identity of FC Barcelona, as well as introduce foundational Web3 concepts and their application to club values and participation.
- **Iterative Refinement and Sequencing:** The team iteratively reviewed, reordered, and clarified learning targets to ensure logical progression, actionable outcomes, and alignment with both club history and future technological engagement.
- **Technical and Conceptual Clarity in Web3 Learning Targets:** Anna, Yoram, and James focused on ensuring that technical concepts like decentralization, permanence, interoperability, and digital identity are clearly explained and grounded in real-world analogies and actionable learning targets for fans.
 - **Explaining Web3 Fundamentals:** The group identified key Web3 concepts—such as blockchain permanence, decentralization, and interoperability—and discussed how to translate these into clear, relatable learning targets for fans.
 - **Use of Analogies and Real-World Examples:** Anna suggested using analogies and real-world examples to make abstract concepts like decentralization and digital identity more accessible, such as comparing wallets to identity tools rather than bank accounts.
 - **Empowering Fans Through Knowledge:** The team emphasized that learning targets should empower fans to understand and apply Web3 concepts, enabling them to participate in and improve community initiatives without needing permission from centralized authorities.
 - **Consideration of Global Audience:** Yoram raised the importance of making content relevant and accessible to fans in developing countries and diverse demographics, ensuring inclusivity in the design of learning targets.
- **Next Steps and Prototyping of Fan Engagement Platform:** James outlined the next steps for the team, including finalizing learning targets, prototyping the fan engagement platform, and iteratively refining both content and design based on team feedback.
 - **Prototyping Platform Design:** James shared early prototypes of the fan engagement platform, discussing layout, color schemes, and the

integration of videos, images, and Discord links to support the learning experience.

- **Iterative Content Development:** The team agreed to continue refining learning targets and platform features, with the understanding that assignments and lessons can be updated as needed, and that the next meeting will focus on further developing module content.

Tasks:

- **Learning Targets Review and Finalization:** Review and refine the learning targets for cycle one (module 102) and come with ideas for improvement for discussion in the next meeting. (the team)
- **Learning Targets Language Precision:** Ensure the language used in the learning targets is precise, broad enough for flexibility, but specific enough to avoid confusion, especially regarding terms like "credential badges" and references to Web3 technology. (the team)
- **Prototype Landing Page Feedback:** Provide feedback on the prototype landing page design, including layout, color balance, and content placement, after further iterations are shared. (the team)
