

Milestone 2 Session 4

AI-generated Notes

- **Milestone 2 Preparation and Deliverables:** James led the team, including Anna, Lucia, Eric, and others, through the final steps required to deliver Milestone 2, focusing on finalizing learning targets, setting up the treasury, and clarifying deliverable formats for the Catalyst team.
 - **Milestone 2 Scope and Outputs:** James reviewed the agenda and outlined the main outputs for Milestone 2: onboarding Barça Vision's team, developing the Learn-to-Work program, approving modules and work opportunities, and setting up the smart-contract enabled treasury. The team confirmed that most hard work was complete and only final steps remained.
 - **Learning Targets Finalization:** The group conducted a detailed review of the learning targets for Cycle 1, discussing language, capitalization, and clarity. They agreed to remove the word 'institutional' for a friendlier tone and clarified the description of fan communities, ensuring the targets were concise and understandable.
 - **Treasury Setup and Prerequisites:** James explained that the treasury could not be created until the student learning targets were finalized and approved, as these targets generate a hash that acts as a prerequisite for treasury access. The team agreed to start with one treasury gated by completion of Cycle 1, with the option to add more as additional cycles are released.
 - **Deliverable Formats for Catalyst:** The team discussed how to present outputs to the Catalyst team, considering both a document (PDF/Word) and a public landing page. They decided to share documents with Catalyst for now and wait to publish more broadly until all cycles and content are finalized.
 - **Next Steps and Responsibilities:** James confirmed he would create the first treasury and share the contract address, while the rest of the team would take the lead on preparing deliverables 2 and 3. They agreed

to collaborate via email and SharePoint, with a follow-up meeting to be scheduled as needed.

- **Technical Walkthrough: Blockchain, Hashes, and UTXOs:** James provided a comprehensive technical walkthrough for the team, demonstrating how learning targets are hashed and stored on the Cardano blockchain, explaining UTXOs, and answering questions about wallet transactions and blockchain verification.
 - **Hashing Learning Targets:** James explained that learning targets are combined into a single string and hashed, with the resulting hash stored on-chain as a prerequisite for treasury access. He demonstrated how this process ensures that credentials can be verified without exposing the original text.
 - **Blockchain Transactions and Costs:** The team reviewed the process of approving and minting learning targets on Cardano, including transaction details, outputs, and associated costs (1.59 ADA plus a transaction fee). James clarified that most outputs return change to the wallet, similar to receiving change after a purchase.
 - **Understanding UTXOs:** James described how Cardano and Bitcoin use UTXOs (Unspent Transaction Outputs) to manage wallet balances, showing examples of multiple UTXOs with varying ADA and token amounts. He explained how each transaction consumes and creates UTXOs, forming a chain of transactions.
 - **Wallet Transactions and Verification:** The group explored real wallet transactions, tracing payments from Catalyst to their project wallet and discussing how multiple outputs can be sent in a single transaction. James emphasized the transparency of blockchain and the ability to verify all transactions and credentials.
 - **NFTs and Data Storage:** James contrasted the storage of hashes for learning targets with typical NFT implementations, noting that while NFT images are stored off-chain, their approach keeps essential credential data verifiable on-chain, enhancing trust and transparency.
- **Project Structure and User Experience Planning:** James and the team discussed the structure of projects and treasuries, the user experience for fans, and the integration of the Andamio platform with Discord and a dedicated app for Barça Vision.

- **Project and Treasury Structure:** The team clarified that each project on the Andamio platform would have its own treasury, gated by specific credentials. They decided to start with one project/treasury after Cycle 1 and add more as needed, ensuring flexibility in rollout.
- **User Experience for Fans:** James recommended that fans should not be exposed to technical terms like 'project' or 'treasury.' Instead, fans will see opportunities based on their credentials, providing a seamless and unified experience.
- **Platform Integration Plans:** The group confirmed that initial development and testing would occur on the Andamio platform, with plans to later wrap content in a dedicated Barça Vision app and integrate with Discord for broader fan engagement.
- **Learning Targets and Content Development:** The team collaboratively refined the learning targets for Cycle 1, ensuring clarity, cultural accuracy, and alignment with Barça Vision's values, and discussed the approach for content development across all cycles.
 - **Refining Learning Targets:** Participants debated the wording, capitalization, and translation of key terms in the learning targets, ultimately agreeing on concise, culturally appropriate language that would be clear to both local and international audiences.
 - **Content Alignment and Examples:** The team ensured that each learning target was distinct and covered a unique aspect of Barça Vision's identity, values, and fan communities, with examples and explanations to guide lesson development.
 - **Approval and Locking of Targets:** After finalizing the language, the team approved and locked the learning targets for Cycle 1, making them immutable and ready for on-chain minting.
- **Future Planning and Stakeholder Engagement:** The team discussed next steps for deliverables, stakeholder engagement (including the finance department), and plans for future meetings and content review.
 - **Division of Responsibilities:** James assigned the creation of the first treasury and blockchain link to himself, while the rest of the team would prepare deliverables 2 and 3, with ongoing feedback and collaboration.

- **Finance Department Engagement:** The group acknowledged the finance department's interest in blockchain transactions and planned to arrange a dedicated session to address their questions and ensure understanding.
- **Follow-Up and Timeline:** They agreed to coordinate via email and SharePoint, aiming to submit Milestone 2 by the middle of the following week, with a follow-up meeting to be scheduled as progress dictates.

Tasks:

- **Milestone 2 Deliverables Documentation:** Create and share documents for deliverables 2 and 3 with the Catalyst team, including links to the live and accessible program outline and approved module work opportunities. (SCN)
- **Milestone 2 Deliverables Documentation:** Paste AI-generated video summaries inside the same folder as the mp4s for team access. (SCN)
- **Treasury Creation and Communication:** Create the first treasury gated by learning cycle number one and send the address and blockchain link to the treasury contract via email. (James)
- **Milestone 2 Deliverables Documentation:** Start working on deliverables 2 and 3, and notify James when the team is ready for a follow-up meeting to review and finalize the outputs. (SCN)
